RSGAN: Recursive Stacked Generative Adversarial Network for Conditional Video Generation

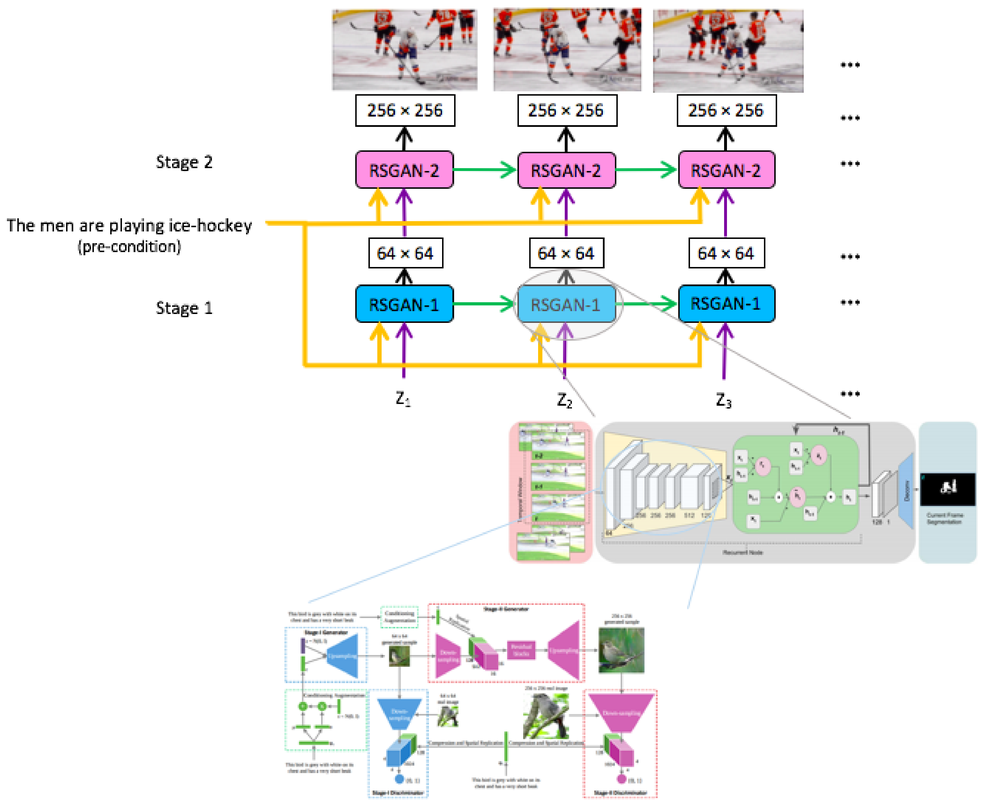
S. Naha, K. M. Nayem and M. L. Islam School of Informatics and Computing, Indiana University

Introduction

Generating video frames based on a pre-condition is a challenging problem and requires understanding of per frame contents and visual dynamics and their relevacies to the pre-condition. In this project, we propose a novel Recurrent Stacked Generative Adversarial Network (RSGAN) based model to generate video frames based on a given pre-condition. In our knowledge, this is the first work to address the problem of conditional video generation using adversarial network. We can address the problem of generating videos based on pre-conditions such as,

1. action classest
2. fMRI signals
3. sentence descriptions

Our Approach



Objective Function

Conditioned on Gaussian latent variables c_0, Stage-I RSGAN trains discriminator D_0 and generator G_0 by alternatively maximizing $\mathcal{L}_{D_o}$ and minimizing $\mathcal{L}_{G_o}$.

Stage-I RSGAN:

$$\mathcal{L}_{D_o} = \mathbb{E}_{(I_o,t)\sim p_{data}}[logD_0(I_0,\varphi_t)] + \mathbb{E}_{z\sim p_z, t\sim p_{data}}[log(1-D_0(G_0(z,c_0),\varphi_t))]$$
$$\mathcal{L}_{G_o} = \mathbb{E}_{z\sim p_z, t\sim p_{data}}[log(1-D_0(G_0(z,c_0),\varphi_t))] + \lambda D_{KL}(\mathcal{N}(\mu_0(\varphi_t),\sum_0(\varphi_t))||\mathcal{N}(0,I))$$

Conditioned on the low resulation sample s_0 and Gaussian latent variables c, discriminator D and generator G in Stage-II RSGAN is trained by alternatively maximizing $\mathcal{L}_D$ and minimizing $\mathcal{L}_G$.

Stage-II RSGAN:

$$\mathcal{L}_D = \mathbb{E}_{(I,t)\sim p_{data}}[logD(I,\varphi_t)] + \mathbb{E}_{s_o\sim pG_o, t\sim p_{data}}[log(1-D(G(s_0,c),\varphi_t))]$$
$$\mathcal{L}_G = \mathbb{E}_{s_o\sim pG_o, t\sim p_{data}}[log(1-D(G(s_0,c),\varphi_t))] + \lambda D_{KL}(\mathcal{N}(\mu(\varphi_t),\sum(\varphi_t))||\mathcal{N}(0,I))$$

Result

- Right now, we are trying to generate video with simple details. That's why we are using Kinect skeleton video as dataset.
- Due to two stage adversial network systems, it takes around 3days to train each stages in Future System of IU.

Future Research

- Generate video with complex details and multiple moving objects.
- Use fMRI dataset of human brain, to generate video.
